

Improving Refrigeration Maintenance with Tech Assist

What is Rack Viewer?

Rack Viewer is a new tab within the Tech Assist application. You can also access the Rack Viewer by clicking on one of the Rack badges within Store Viewer.

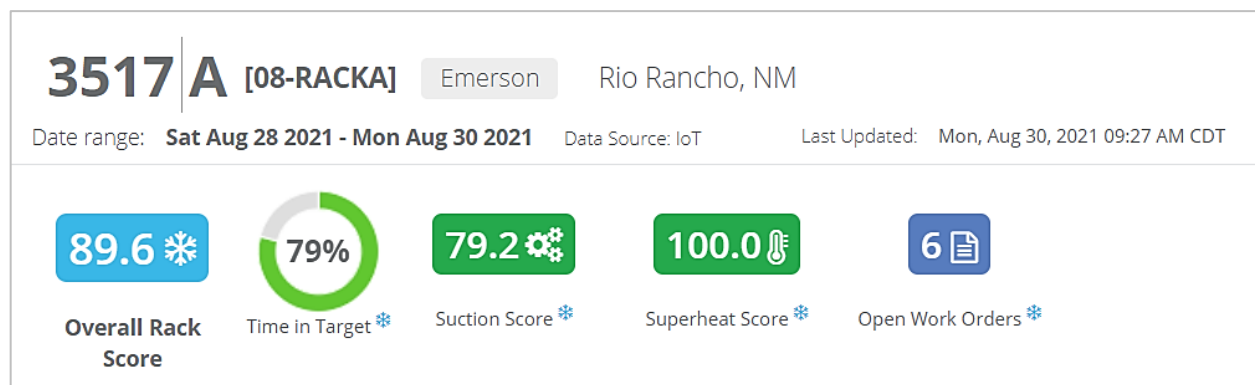

Where data is available in Rack Viewer?

Rack Viewer shows the following when data is available:

- **Summary** - Overall rack health score, time in target, suction score and superheat score.
- **Circuit performance** - listing time in target for each case on the circuit.
- **Compressor performance** - showing run time, lockout and proof status for each compressor
- **Suction pressure / temperature chart** - A chart showing suction pressure and temperature telemetry w/ the ability to overlay circuit temperatures, compressor lockouts and proofs.
- **Superheat chart** - A chart showing rack superheat values. If superheat is not available directly from the controller, it is calculated and shown using suction pressure, temperature, and refrigerant type for the rack.
- **Receiver float level chart** - shows receiver float values for racks with analog float sensors. The chart is color coded to show values approaching alarm status.
- **Workorders** - a list of workorders associated with the rack (last 30 days)

Rack Viewer will adjust to available data and show the maximum amount of information possible. The data available depends on several factors including IoT vs IMS, controller types, and sensor availability. Some stores such as IoT/Emerson are very rich in data, others provide less information.
